

IN THE CLAIMS:

1. (currently amended) A method for-extracorporeal blood treatment, comprising the steps of:

providing a blood treatment machine including ~~at least two pumps~~ at least one pump and a disposable filter; a fluid circuit including a blood withdrawal line, a blood return line, and a waste line being connected to said filter;

a replacement fluid line connected to said tubing set to dilute blood carried in at least one of said blood return and blood withdrawal lines;

connecting the patient's vascular system to the blood withdrawal and return lines;

engaging a single member carrying said waste, replacement fluid, and blood withdrawal lines to a treatment machine;

the member and treatment machine being configured such that by said step of engaging a single member, said at least one pump is enabled to pump fluid through said waste, withdrawal and return lines;

~~connecting said waste, replacement fluid, and said blood withdrawal lines to engage at least one pump of said blood treatment machine;~~

~~said step of connecting including closing a single engagement element of said blood treatment machine such that all of said waste, replacement fluid, and said blood withdrawal lines are engaged with said at least one pump in a single step;~~

withdrawing blood through a blood withdrawal line at a rate of at least 300 ml/min.;

passing the blood through a filter to remove waste;

and passing the filtered blood through a blood return line and into the patient, wherein blood is withdrawn from and returned to the patient continuously for about 1.5 hours, and wherein the blood flow rate is at least 400 ml./min.

2-3 (canceled).

4. (Original) The method of claim 1, wherein the blood withdrawal line, the filter, and the blood return line are pre-attached and disconnectable from said treatment machine.

5. (Original) The method of claim 1, wherein an amount of replacement fluid is added to the blood, and wherein the amount is determined by gravimetric balancing of the replacement fluid and the waste.

6. (Original) The method of claim 1, further comprising step of repeating the procedure at least daily.

7. (Original) The method of claim 1, wherein the procedure is conducted at home.

8. (Original) The method of claim 5, wherein the amount of the replacement fluid is approximately 9-13 liters.

9. (Original) The method of claim 5, wherein the replacement fluid is added to the blood after filtration.

10. (Original) The method of claim 1, further comprising the step of repeating the procedure for more than one week.

11. (Original) The method of claim 1, further comprising the steps of connecting the blood withdrawal line to the patient and connecting the blood return line to the patient.

12 (Original) the method of claim 11, wherein the blood withdrawal line and the blood return line are connected to the patient through a subcutaneous port.

13. (currently amended) A method for hemofiltration, comprising the steps of:

withdrawing blood through a blood withdrawal line at a rate of at least 300 ml/min.;
passing the blood through a filter to remove waste;
and passing the filtered blood through a blood return line and into the patient, wherein
blood is withdrawn from and returned to the patient continuously for about 1.5 hours, and
wherein the blood flow rate is at least 400 ml./min;
pumping the withdrawn blood with a pump at a predetermined blood flow rate;
measuring the actual blood flow rate delivered by the pump using a flow sensor;
comparing the actual blood flow rate with ~~the predetermined~~ a blood flow rate indicated
by a pump speed;
and activating an alarm when the difference between the actual blood flow rate with the
~~the predetermined~~ blood flow rate indicated by a pump speed exceeds a predetermined value.

14. (previously presented) The method of claim 1, wherein the blood withdrawal line and
the blood return line are in registry with said at least one pump and said at least one pump
includes a peristaltic pump.

15. (original) The method of claim 1, wherein at least one of the blood withdrawal line
and the blood return line further comprises a leak detector.

16. (canceled).

17. (new) A method as in claim 13, further comprising measuring pressure responsively
to said difference.

18. (new) A method as in claim 13, wherein said flow sensor is an ultrasonic sensor.
